

GeoNews App

GeoNews is an open source news application for serving location based news. It is an android app designed to get the news of almost any part of the world by using map pointer. One just has to place the map pointer in the desired location of the map and swipe the snackbar to get the news of that location. It is developed by me and teammates of Developer Student Club KIIT as an Android based project.

After that a map fragment screen opens:

We can put the pointer anywhere on it and it fetches the news of that location.

The application uses 3 Api's Google Maps Geo Location, Firebase Auth REST API & News API.
